

Have you been diagnosed with celiac disease and are between the ages of 18 and 70?

You may be eligible to take part in Phase II clinical research trial at Beth Israel Deaconess Medical Center if you are willing to strictly follow the gluten-free diet, are symptom free and can attend multiple study visits.

What is the goal of this study?

This trial is designed to test if a new drug, TIMP-GLIA, is able to help your patients with celiac disease tolerate gluten. The results from this trial will help inform future treatments for people living with celiac disease.

What will happen during this study?

- ~3 months participation from the first study visit to the last, during which time you will maintain eating your gluten free diet
- 10 outpatient visits to BIDMC
- 2 doses of the study drug, TIMP-GLIA, or placebo (salt water) via IV infusion
- 2 endoscopy procedures
- 14 day gluten challenge (lower dose after first 3 days)
- Collection of blood, genetic testing for celiac disease, urine samples, safety monitoring and medical history review

All study procedures will be covered by our study fund and of no cost to you. Monetary compensation for your time and participation is available.
